Experience

Overall: 10-12 years

Role Summary

As an Associate Database Architect, the person will be responsible for defining, designing, and governing end-to-end database architecture with a strong focus on GCP AlloyDB PostgreSQL.

This role demands deep expertise in distributed PostgreSQL systems, performance engineering, ensuring highly scalable, secure, and high-performance solutions aligned with business and enterprise standards.

The architect will act as a technical authority, driving database modernization, cloud migration, and database optimization for high throughput, low latency, and high availability systems deployed across multiple regions.

Key Responsibilities

Database engineer & Data Architecture

Design, enhance, and maintain multi-region AlloyDB PostgreSQL clusters on GCP

Architect for high availability, failover, and cross-region replication

Optimize read/write distribution, latency, and throughput across regions

Perform deep AlloyDB/PostgreSQL performance tuning

Able to review most optimized Postgres code

Diagnose complex production issues & provide solution for problems like:-

Idle transactions

Long-running queries

Subtransaction overhead and lock contention

Slow stored procedure execution

Analyze and optimize queries using EXPLAIN / ANALYZE

Fine-tune PostgreSQL/AlloyDB parameters for:

Parallel query execution

CPU and memory utilization

High concurrency workloads

VACUUM and AUTOVACUUM internals

Drive data modelling (conceptual, logical, physical) and schema governance

Define indexing strategies and query optimization standards

Own backup, DR, retention, and database security strategies

Lead database migration and modernization (on-prem → cloud, legacy → modern DBs)

Have good knowledge in pre-identifying DB critical stages

Governance & Technical Leadership

Conduct database architecture reviews and design walkthroughs

Mentor team of database developers

Collaborate with product owners, business stakeholders, and security teams

Support estimations and technical solutioning for databases when required

Required Technical Skills

Databases

AlloyDB PostgreSQL (deep internals)

Writing high throughput queries and SPs

Other RDBMS: Oracle

Experience with large data volumes, OLTP/OLAP, and high-throughput systems

Strong expertise in debugging, data modeling and performance engineering

Security & Reliability

Secure design principles, IAM, encryption, auditing, compliance for Alloy DB PostgreSQL

Observability: logging, monitoring, tracing for Alloy DB PostgreSQL database

DR, resilience, and fault-tolerant design for Alloy DB PostgreSQL

Good to Have

Experience with data platforms: BigQuery, Databricks, Redshift, Snowflake

NoSQL: MongoDB

Exposure to ETL and streaming architectures

Experience in regulated environments (finance, data-privacy heavy systems)

GCP Professional Cloud Database Engineer

Soft Skills

Strong stakeholder communication and technical storytelling

Decision-making with clear trade-off analysis

Mentoring and technical leadership
